Need for higher rates in 5G

Global mobile traffic (ExaBytes per month)

Ericsson Mobility Report, 11/2016

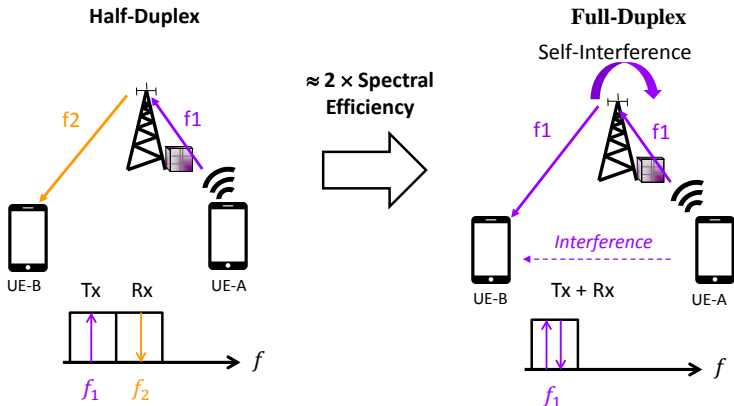

How to meet this demand?

- ↑ antennas at the base station → massive MIMO
- ↑ spectrum → mmWave
- ↑ cells → densification
- ↑ spectral efficient? → **evolve** half-duplex (HD)

Half-Duplex

Half-Duplex versus Full-Duplex

- Half-Duplex (HD) systems \rightarrow Inefficient resource utilization
- Full-Duplex (FD) systems $\rightarrow \sim 2 \times$ spectral efficiency

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
5. Numerical Results
6. Conclusions

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
5. Numerical Results
6. Conclusions

Benefits

- Spectral efficiency: $\sim 2\times$
- MAC layer: hidden terminal, collision avoidance, reduced end-to-end delay...

Challenges

- **Severe** self-interference (SI)
- UE-to-UE interference
- User to frequency channels pairing and power allocation

Need of distributed schemes

- Processing burden at the BS is high*
 - Dense deployment of user
 - New SI cancellation mechanisms
 - Radio Resource Management

Lack of fair and efficient cross-layer procedures

- How to mitigate UE-to-UE interference and assess fairness?
 - Pairing → UL and DL users to share the frequency resource
 - Power allocation → mitigate interference
 - Fairness → weighted sum spectral efficiency maximization

* A. Osseiran et al., "Scenarios for 5G mobile and wireless communications: the vision of the METIS project," IEEE Communications Magazine, vol. 52, no. 5, pp. 26-35, May 2014.

- Study sum spectral efficiency maximization and fairness problem
 - Joint pairing and power allocation \rightarrow maximize weighted sum spectral efficiency
- Solve this MINLP problem
 - Lagrangian duality \rightarrow optimal power allocation + optimal centralized assignment
- Provide distributed mechanisms for FD cellular networks
 - Distributed auction algorithm \rightarrow resource assignment to UL and DL users
- Show spectral efficiency gains over HD with distributed schemes
 - Realistic system simulations \rightarrow **Yes, 89%!**

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
5. Numerical Results
6. Conclusions

Definitions (1)

- Single-cell cellular system + only BS is FD-capable
- UL users $\rightarrow I$; DL users $\rightarrow J$; Frequency channels $\rightarrow F$
- Effective path gain values $\rightarrow G_{ib}, G_{bj}, G_{ij}$
- SI cancellation coefficient $\rightarrow \beta$
- Assignment matrix $\rightarrow \mathbf{X} \in \{0, 1\}^{I \times J}$

$$x_{ij} = \begin{cases} 1, & \text{if the UL } UE_i \text{ is paired with the DL } UE_j, \\ 0, & \text{otherwise.} \end{cases}$$

- Power vectors $\rightarrow \mathbf{p}^u = [P_1^u \dots P_I^u]$, $\mathbf{p}^d = [P_1^d \dots P_J^d]$
- SINR at the BS and at DL user

$$\gamma_i^u = \frac{P_i^u G_{ib}}{\sigma^2 + \sum_{j=1}^J x_{ij} P_j^d \beta}, \quad \gamma_j^d = \frac{P_j^d G_{bj}}{\sigma^2 + \sum_{i=1}^I x_{ij} P_i^u G_{ij}}.$$

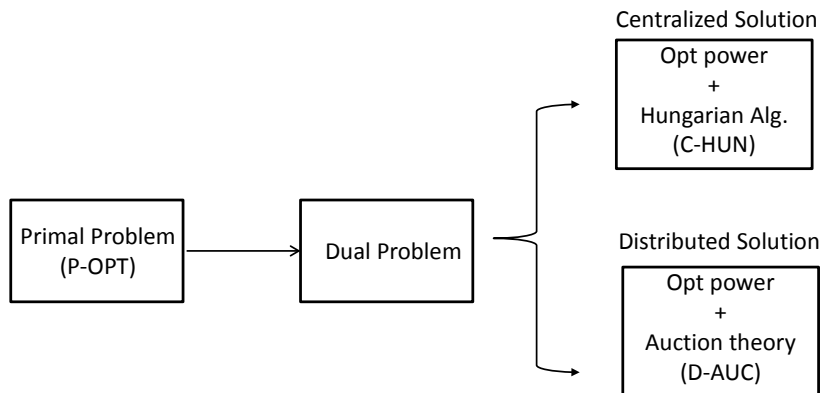

- Achievable spectral efficiency

$$C_i^u = \log_2(1 + \gamma_i^u), \quad C_j^d = \log_2(1 + \gamma_j^d).$$

- Weights α_i^u, α_j^d
 - $\alpha_i^u = \alpha_j^d = 1, \forall i, j \rightarrow$ Sum spectral efficiency maximization
 - $\alpha_i^u = G_{ib}^{-1}, \quad \alpha_j^d = G_{bj}^{-1} \rightarrow$ Path loss compensation

- Weighted sum spectral efficiency maximization (P-OPT)

$$\begin{aligned} & \underset{\mathbf{X}, \mathbf{p}^u, \mathbf{p}^d}{\text{maximize}} && \sum_{i=1}^I \alpha_i^u C_i^u + \sum_{j=1}^J \alpha_j^d C_j^d \\ & \text{subject to} && \gamma_i^u \geq \gamma_{\text{th}}^u, \quad \forall i, \\ & && \gamma_j^d \geq \gamma_{\text{th}}^d, \quad \forall j, \\ & && P_i^u \leq P_{\text{max}}^u, \quad \forall i, \\ & && P_j^d \leq P_{\text{max}}^d, \quad \forall j, \\ & && \sum_{i=1}^I x_{ij} \leq 1, \quad \forall j, \\ & && \sum_{j=1}^J x_{ij} \leq 1, \quad \forall i, \\ & && x_{ij} \in \{0, 1\}, \quad \forall i, j. \end{aligned}$$

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
5. Numerical Results
6. Conclusions

- Formulate partial Lagrangian function

$$L(\boldsymbol{\lambda}^u, \boldsymbol{\lambda}^d, \mathbf{X}, \mathbf{p}^u, \mathbf{p}^d) \triangleq - \sum_{i=1}^I \alpha_i^u C_i^u - \sum_{j=1}^J \alpha_j^d C_j^d + \\ + \sum_{i=1}^I \lambda_i^u (\gamma_{\text{th}}^u - \gamma_i^u) + \sum_{j=1}^J \lambda_j^d (\gamma_{\text{th}}^d - \gamma_j^d)$$

- The dual function is

$$g(\boldsymbol{\lambda}^u, \boldsymbol{\lambda}^d) = \inf_{\mathbf{X} \in \mathcal{X}, \mathbf{p}^u, \mathbf{p}^d \in \mathcal{P}} L(\boldsymbol{\lambda}^u, \boldsymbol{\lambda}^d, \mathbf{X}, \mathbf{p}^u, \mathbf{p}^d)$$

- Rewrite the dual as

$$g(\boldsymbol{\lambda}^u, \boldsymbol{\lambda}^d) = \inf_{\mathbf{X} \in \mathcal{X} \ \mathbf{p}^u, \mathbf{p}^d \in \mathcal{P}} \sum_{n=1}^N \left(q_{i_n}^u(\mathbf{X}, \mathbf{p}^u, \mathbf{p}^d) + q_{j_n}^d(\mathbf{X}, \mathbf{p}^u, \mathbf{p}^d) \right),$$

with

$$q_{i_n}^u(\mathbf{X}, \mathbf{p}^u, \mathbf{p}^d) \triangleq \lambda_{i_n}^u \left(\gamma_{\text{th}}^u - \gamma_{i_n}^u \right) - \alpha_{i_n}^u C_{i_n}^u,$$

$$q_{j_n}^d(\mathbf{X}, \mathbf{p}^u, \mathbf{p}^d) \triangleq \lambda_{j_n}^d \left(\gamma_{\text{th}}^d - \gamma_{j_n}^d \right) - \alpha_{j_n}^d C_{j_n}^d.$$

- A closed expression for the assignment

$$x_{ij}^* = \begin{cases} 1, & \text{if } (i, j) = \arg \max_{i, j} \left(q_{i_n}^{u, \max} + q_{j_n}^{d, \max} \right) \\ 0, & \text{otherwise} \end{cases}$$

- Analyse the dual problem

$$\begin{aligned} & \underset{\lambda^u, \lambda^d}{\text{maximize}} && g(\lambda^u, \lambda^d) \\ & \text{subject to} && \lambda_i^u, \lambda_j^d, \geq 0, \forall i, j, \end{aligned}$$

- Turn our attention to the power allocation problem

$$\underset{\mathbf{p}^u, \mathbf{p}^d}{\text{minimize}} \quad - \sum_{i=1}^I \alpha_i^u C_i^u - \sum_{j=1}^J \alpha_j^d C_j^d \quad (1a)$$

$$\text{subject to} \quad \mathbf{p}^u, \mathbf{p}^d \in \mathcal{P}. \quad (1b)$$

- Optimal solution for (1) available*†

* A. GjendemsjØ, D. Gesbert, G. E. Øien and S. G. Kiani, "Binary Power Control for Sum Rate Maximization over Multiple Interfering Links," IEEE TWC, vol. 7, no. 8, pp. 3164-3173, August 2008

† D. Feng, L. Lu, Y. Yuan-Wu, G. Y. Li, G. Feng and S. Li, "Device-to-Device Communications Underlying Cellular Networks," IEEE TC, vol. 61, no. 8, pp. 3541-3551, August 2013

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
5. Numerical Results
6. Conclusions

- Reformulate closed expression for assignment with optimal power allocation as

$$\begin{aligned} & \underset{\mathbf{X}}{\text{maximize}} && \sum_{i=1}^I \sum_{j=1}^J c_{ij} x_{ij} \\ & \text{subject to} && \sum_{i=1}^I x_{ij} = 1, \forall j, \\ & && \sum_{j=1}^J x_{ij} = 1, \forall i, \\ & && x_{ij} \in \{0, 1\}, \forall i, j. \end{aligned}$$

- Centralized solution \rightarrow Hungarian Algorithm
- Distributed solution \rightarrow Auction Theory

- Input: c_{ij} , and tolerance ϵ

Bidding Phase

- UL bids for a DL user that maximizes $c_{ij} - \hat{p}_j$
- Wait for acknowledgement on assignment or update price

Assignment Phase

- BS is responsible for DL users
- BS selects the highest bid and update the prices \hat{p}_j
- Send updates and wait until the assignment matrix X is feasible

- Messages exchanged using control channels, e.g., PUCCH or PDCCH

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
- 5. Numerical Results**
6. Conclusions

- $F = I = J$ and $I + J = 8, \dots, 50$
- Path-loss compensation $\rightarrow \alpha_i^u = G_{ib}^{-1}, \quad \alpha_j^d = G_{bj}^{-1}$
- SI cancellation $\beta = [-70, -100]$ dB
- Proposed algorithm
 - **D-AUC**: Dual solution with distributed Auction compared to
 - P-OPT: Primal optimal from brute-force solution
 - C-HUN: Centralized solution based on Duality and Hungarian algorithm
 - R-EPA: Random assignment + equal power allocation
 - HD: Traditional Half-Duplex scheme

Optimality Gap Comparison with $\beta = -100\text{dB}$

- Negligible difference between P-OPT, C-HUN and D-AUC
- Possible to use distributed solutions without losing too much

Sum Spectral Efficiency Comparison for different β

- $\beta = -110\text{dB}$ \rightarrow UE-to-UE interference is the limiting factor
- $\beta = -70\text{dB}$ \rightarrow residual SI is the limiting factor

1. Introduction
2. System Model for Spectral Efficiency Maximization
3. Centralized Solution Based on Lagrangian Duality
4. Distributed Solution Based on Auction Theory
5. Numerical Results
- 6. Conclusions**

- Distributed algorithms to FD cellular networks
 - Perform close to centralized schemes
 - Fair and efficient
 - Almost double spectral efficiency (**89% gain**)
- Trade-off: residual SI \times UE-to-UE interference
 - UE-to-UE interference is the limiting factor for low β
 - Residual SI is the limiting factor for high β
