Heuristic Introduction

Let us consider a system of two identical particles with positions $x_1, x_2$ in the 2-dimensional euclidean space. Since

$$|\psi(x_2, x_1)|^2 = |\psi(x_1, x_2)|^2,$$

by the indistinguishability, then we have

$$\psi(x_2, x_1) = e^{i\alpha\pi} \psi(x_1, x_2), \quad \alpha \in [0, 1].$$

Fundamental particles

Bosons satisfy (1) with $\alpha = 0$,
Fermions satisfy (1) with $\alpha = 1$.

For $\alpha \in (0, 1)$ the wave function is multivalued!
Heuristic Introduction

Let us consider a system of two identical particles with positions $x_1, x_2$ in the 2-dimensional euclidean space.

Since

$$|\psi(x_2, x_1)|^2 = |\psi(x_1, x_2)|^2,$$

by the indistinguishability, then we have

$$\psi(x_2, x_1) = e^{i\alpha \pi} \psi(x_1, x_2), \quad \alpha \in [0, 1]. \quad (1)$$

Fundamental particles

Bosons satisfy (1) with $\alpha = 0$,

Fermions satisfy (1) with $\alpha = 1$.

For $\alpha \in (0, 1)$ the wave function is multivalued!
Heuristic Introduction

Let us consider a system of two identical particles with positions $x_1, x_2$ in the 2-dimensional euclidean space. Since

$$|\psi(x_2, x_1)|^2 = |\psi(x_1, x_2)|^2,$$

by the indistinguishability, then we have

$$\psi(x_2, x_1) = e^{i\alpha \pi} \psi(x_1, x_2), \quad \alpha \in [0, 1].$$

(1)

Fundamental particles

**Bosons** satisfy (1) with $\alpha = 0$.

**Fermions** satisfy (1) with $\alpha = 1$.

For $\alpha \in (0, 1)$ the wave function is multivalued!
This multivaluedness of the wave functions leads to consider a new formulation of Quantum Mechanics which extends to non-simply connected configuration spaces. In our case, the \( N \)-particles configuration space \( \Gamma_N \) is

\[
\Gamma_N = \mathbb{R}^{2N} \setminus \bigcup_{i < j} \{ X = (x_1, \ldots, x_N) | x_i = x_j \},
\]

whose 1st homotopy group is the braid group of \( N \) elements \( \mathbb{B}_N \)! The wave functions are sections of a fiber bundle over \( \Gamma_N \), in this picture.
One can still choose to work with regular wave functions, via a suitable \textbf{gauge transformation}

Indeed, one can consider the so called \textbf{bosonization operator} which maps multivalued wave functions into conventional ones.

\textbf{Definition}

Let $\mathbf{X} = (x_1, \ldots, x_N)$. Set $z^j := x^1_j + ix^2_j$, for $j = 1, \ldots, N$. For any $\alpha \in (0, 1]$ we define the bosonization operator $\mathcal{U}_\alpha : L^2_{\alpha\text{-any}}(\mathbb{R}^{2N}) \rightarrow L^2_{\text{sym}}(\mathbb{R}^{2N})$ on $\alpha$-anyonic function as

\[
(\mathcal{U}_\alpha \psi)(\mathbf{X}) := \prod_{j<k} \frac{|z^j - z^k|^\alpha}{(z^j - z^k)_\alpha} \psi(\mathbf{X}) = \prod_{j<k} e^{-\alpha \cdot \arg(z^j - z^k)} \psi(\mathbf{X}).
\]
Bosonization Map

One can still choose to work with regular wave functions, via a suitable gauge transformation.
Indeed, one can consider the so called bosonization operator which maps multivalued wave functions into conventional ones.

Definition
Let \( X = (x_1, \ldots, x_N) \). Set \( z^j := x_j^1 + ix_j^2 \), for \( j = 1, \ldots, N \). For any \( \alpha \in (0, 1] \) we define the bosonization operator \( U_\alpha : L^2_{\alpha \text{-any}}(\mathbb{R}^{2N}) \rightarrow L^2_{\text{sym}}(\mathbb{R}^{2N}) \) on \( \alpha \)-anyonic function as

\[
(U_\alpha \psi)(X) := \prod_{j<k} \frac{|z^j - z^k|^\alpha}{(z^j - z^k)^\alpha} \psi(X) = \prod_{j<k} e^{-\alpha \cdot \arg(z^j - z^k)} \psi(X).
\]

Let \( \alpha < 1 \), this expression is bounded from below and is closed.

\( \alpha = 1 \) is the standard bosonization.
Bosonization Map

One can still choose to work with regular wave functions, via a suitable gauge transformation.

Indeed, one can consider the so-called bosonization operator which maps multivalued wave functions into conventional ones.

**Definition**

Let \( X = (x_1, \ldots, x_N) \). Set \( z^j := x^1_j + ix^2_j \), for \( j = 1, \ldots, N \). For any \( \alpha \in (0, 1] \) we define the bosonization operator \( U_{\alpha} : L^2_{\alpha-\text{any}}(\mathbb{R}^{2N}) \to L^2_{\text{sym}}(\mathbb{R}^{2N}) \) on \( \alpha \)-anyonic function as

\[
(U_\alpha \psi)(X) := \prod_{j<k} \frac{|z^j - z^k|^\alpha}{(z^j - z^k)\alpha} \psi(X) = \prod_{j<k} e^{-i\alpha \cdot \arg(z^j - z^k)} \psi(X).
\]
From Anyonic to Magnetic Gauge

This operator simplifies the phase space. On the other hand, the new Hamiltonian contains a singular magnetic interaction term.

Aharonov-Bohm Potential

**Definition (Aharonov-Bohm(AB) Potential)**

The Aharonov-Bohm potential of intensity $\alpha$ centered in $x_0 \in \mathbb{R}^2$ is the function $A_{x_0}: \mathbb{R}^2 \setminus \{x_0\} \rightarrow \mathbb{R}^2$ defined as follows:

$$A_{x_0}(x) := \alpha \frac{(x - x_0)\perp}{|x - x_0|^2}.$$  

The operator $A_j$ is the multiplication operator which attaches to each particle an AB flux:

$$A_j(x) := \alpha \sum_{\substack{k=1 \atop k \neq j}}^{N} \frac{(x - x_k)\perp}{|x - x_k|^2}.$$
Aharonov-Bohm Potential

Definition (Aharonov-Bohm(AB) Potential)

The Aharonov-Bohm potential of intensity $\alpha$ centered in $x_0 \in \mathbb{R}^2$ is the function $A_{x_0} : \mathbb{R}^2 \setminus \{x_0\} \rightarrow \mathbb{R}^2$ defined as follows:

$$A_{x_0}(x) := \alpha \frac{(x - x_0)\perp}{|x - x_0|^2}.$$ 

The operator $A_j$ is the multiplication operator which attaches to each particle an AB flux:

$$A_j(x) := \alpha \sum_{\substack{k=1\ N \ N \neq j}} (x - x_k)\perp/|x - x_k|^2.$$
Motivation

Well-posedness and self-adjointness of the Hamiltonian

\[ H_N = \sum_{j=1}^{N} \left[ (-i \nabla_j + A_j(x_j))^2 + \sum_{k>j} v(|x_j - x_k|) + V(x_j) \right], \]

even considering just one of the two potentials, are still open questions.

Pairwise interaction potential

Trapping Potential
Motivation

Well-posedness and self-adjointness of the Hamiltonian

$$H_N = \sum_{j=1}^{N} \left[ (-i \nabla_j + A_j(x_j))^2 + \sum_{k>j} v(|x_j - x_k|) + V(x_j) \right],$$

even considering just one of the two potentials, are still open questions.

\]

even considering just one of the two potentials, are still open questions.

Pairwise interaction potential

Trapping Potential
Consider a system of $N$ non relativistic spinless identical particles with anyonic statistics in two dimensions, consider the Hilbert Space

$$\mathcal{H} := L^2_{sym}(\mathbb{R}^{2N}),$$

and the operator defined on smooth functions supported away from the coincidence hyperplanes

$$D(\mathcal{H}_\alpha) := C^\infty_c(\Gamma_N)$$

$$\mathcal{H}_\alpha := \sum_{j=1}^{N} (D^j_\alpha)^2,$$

where $D^j_\alpha := -i\nabla + A_j$. 

Since $\mathbb{R}^{2N} \setminus \Gamma_N$ has Lebesgue measure zero, $\mathcal{H}_\alpha$ is a densely defined symmetric operator $\Rightarrow$ it is closable.

Furthermore $\mathcal{H}_\alpha$ is positive and thus there $\exists$ self-adjoint extensions of $\mathcal{H}_\alpha$.

In particular, the Friedrichs extension can be considered, by taking the closure of the quadratic form associated to $\mathcal{H}_\alpha$.

The case with $N = 2$ can also be studied by means of Von Neumann’s theory of the self-adjoint extensions of a symmetric densely defined operator.

VN’s Approach to the Extensions

Set $N = 2$. Our configuration space is

$$\Gamma_2 = \mathbb{R}^4 \setminus \{ x_1 = x_2 \}. \quad (2)$$

In any inertial reference frame, with coordinates $x_1 = (x_1^1, x_1^2)$, $x_2 = (x_2^1, x_2^2)$, two particles are described by the operator

$$\mathcal{H}_\alpha = (-i \nabla_1 + A_1)^2 + (-i \nabla_2 + A_2)^2, \quad (3)$$

where $A_1(x) = \alpha (x_1 - x_2)^\perp |(x_1 - x_2)|^2$, $A_2(x) = \alpha \frac{(x_2 - x_1)^\perp}{|(x_1 - x_2)|^2}$. 
The extraction of the center of mass leads to a major simplification. By changing coordinates to

\[
\begin{align*}
X &:= \frac{x_1 + x_2}{2} \\
r &:= x_1 - x_2,
\end{align*}
\]

the operator splits

\[
\mathcal{H}_\alpha = -\frac{\Delta X}{2} + 2(-i \nabla r + A_{\text{rel}}(r))^2,
\]

where

\[
A_{\text{rel}}(r) := \alpha \frac{r^\perp}{|r|^2}.
\]
Extraction of the Center of Mass

The extraction of the center of mass leads to a major simplification. By changing coordinates to

\[
\begin{cases} 
X := \frac{x_1 + x_2}{2} \\
r := x_1 - x_2, 
\end{cases}
\]  

(4)

the operator splits

\[
H_\alpha = -\frac{\Delta X}{2} + 2(-i \nabla_r + A_{\text{rel}}(r))^2, 
\]  

(5)

where

\[
A_{\text{rel}}(r) := \alpha \frac{r^\perp}{|r|^2}. 
\]
A Single Particle in an AB Flux

A particle subject to the Aharonov-Bohm potential

In [Adami, Teta, 1998] the problem of self-adjointness of the Hamiltonian of a particle on the plane subject to an AB potential is studied.

Phys. Rev. 115, 485 1959
1-Particle Hamiltonian

The Hamiltonian reads

\[
\mathcal{D}(\mathcal{H}_\alpha) := C_c^\infty(\mathbb{R}^2 \setminus \{0\})
\]

\[
\mathcal{H}_\alpha := -\Delta - 2i\alpha \frac{x}{|x|^2} \nabla + \frac{\alpha^2}{|x|^2},
\]

where the \(\alpha\) depends both on the charge of the particle and the flux generated by the solenoid. This operator defined on smooth functions is only symmetric and it admits a 4-parameter family of s.a. extensions.

2 Anyons

One has to take into account the symmetry constraints imposed by the indistinguishability of the two particles!
Von Neumann Theory

We return to our problem.

The starting operator, in polar coordinates, reads

\[
\begin{cases}
D(H_\alpha) := C_c^\infty(\mathbb{R}^+) \otimes L^2_{\text{even}}([0, 2\pi]), \\
H_\alpha := -\partial_\rho^2 - \frac{1}{\rho} \partial_\rho + \frac{1}{\rho^2} (i\partial_\omega - \alpha)^2,
\end{cases}
\]

where \( L^2_{\text{even}}([0, 2\pi]) := \operatorname{span}_\mathbb{C} \{ e^{2in\omega} \}_{n \in \mathbb{N}} \).

This operator is densely defined and symmetric \( \longrightarrow \) it is closable. Let \( \overline{H_\alpha} \) be its closure.
Von Neumann Theory

We return to our problem.

The starting operator, in polar coordinates, reads

\[
\begin{cases}
  \mathcal{D}(\mathcal{H}_\alpha) := C_c^\infty(\mathbb{R}^+) \otimes L^2_{\text{even}}([0, 2\pi]), \\
  \mathcal{H}_\alpha := -\partial_\rho^2 - \frac{1}{\rho} \partial_\rho + \frac{1}{\rho^2} (i\partial_\omega - \alpha)^2,
\end{cases}
\]

where \( L^2_{\text{even}}([0, 2\pi]) := \text{span}_\mathbb{C} \{ e^{2in\omega} \}_{n\in\mathbb{N}} \).

This operator is densely defined and symmetric \(\rightarrow\) it is closable.

Let \( \overline{\mathcal{H}_\alpha} \) be its closure.

Perspectives

We return to our problem.
The starting operator, in polar coordinates, reads

$$
\begin{align*}
\mathcal{D}(H_{\alpha}) & := C_c^\infty(\mathbb{R}^+) \otimes L^2_{\text{even}}([0, 2\pi]), \\
H_{\alpha} & := -\frac{\partial^2}{\partial \rho^2} - \frac{1}{\rho} \frac{\partial}{\partial \rho} + \frac{1}{\rho^2} (i\partial_\omega - \alpha)^2,
\end{align*}
$$

where $L^2_{\text{even}}([0, 2\pi]) := \text{span}_{\mathbb{C}} \{ e^{2in\omega} \}_{n \in \mathbb{N}}$.

This operator is densely defined and symmetric $\rightarrow$ it is closable.
Let $\overline{H_{\alpha}}$ be its closure.
**Von Neumann Theory**

We return to our problem.

The starting operator, in polar coordinates, reads

\[
\begin{align*}
&\mathcal{D}(\mathcal{H}_\alpha) := C_c^\infty(\mathbb{R}^+) \otimes L^2_{even}([0, 2\pi]), \\
&\mathcal{H}_\alpha := -\partial_\rho^2 - \frac{1}{\rho} \partial_\rho + \frac{1}{\rho^2} (i\partial_\omega - \alpha)^2,
\end{align*}
\]

where \(L^2_{even}([0, 2\pi]) := \text{span}_\mathbb{C} \{ e^{2in\omega} \}_{n \in \mathbb{N}}\).

This operator is densely defined and symmetric \(\rightarrow\) it is closable.

Let \(\overline{\mathcal{H}_\alpha}\) be its closure.
S.A. Realizations for 2-Anyons

The symmetry constraint actually leads to a different (smaller) family of self-adjoint realizations of the AB-like Hamiltonian. One looks for solutions of the deficiency equations,

\[(\mathcal{H}_\alpha^* - i)\psi_+ = 0,\]
\[(\mathcal{H}_\alpha^* + i)\psi_- = 0.\]

which can be reduced to decoupled Bessel equations for the partial waves,

\[-w''(\rho) + \frac{1}{\rho^2} \left( (2n + \alpha)^2 - \frac{1}{4} \right) w(\rho) = \pm i.\]
VN’s Approach to the Extensions

One finds that both deficiency indices are $d_\pm = 1$. The normalized solutions are

$$
\psi_+ := N_\alpha K_\alpha (\rho e^{-i \frac{\pi}{4}}), \quad \psi_- := N_\alpha e^{i \alpha \frac{\pi}{2}} K_\alpha (\rho e^{i \frac{\pi}{4}}),
$$

where $N_\alpha := \sqrt{2 \cos(\alpha \frac{\pi}{2})} / \pi$ and $K_\alpha$ is the modified Bessel function or Macdonald function.
The deficiency functions have a singularity at the origin, their magnetic gradient $D_\alpha$ is not a square-integrable function. Indeed, when $z \to 0, \forall \alpha \not\in -\mathbb{N}$:

$$K_\alpha(z) = \frac{\Gamma(\alpha)2^{\alpha-1}}{z^{\alpha}} - \frac{\Gamma(1-\alpha)z^\alpha}{\alpha 2^{\alpha+1}} + O(z^{2-\alpha}).$$

Plot of $|\psi_+|^2 = |N_{1/4} K_{1/4} (\rho e^{-i \pi/4})|^2$
Comparison between Different Statistics

2 interacting anyons
Interaction Potential
Perspectives

If we consider the relative Hamiltonian with the symmetry constraints

**Bosons**
$$d_+ = d_- = 1 \quad \psi_+ := N_0 K_0 (\rho e^{-i \pi 4}), \quad \psi_- := N_0 K_0 (\rho e^{i \pi 4}),$$

**Anyons**
$$d_+ = d_- = 1 \quad \psi_+ := N_\alpha K_\alpha (\rho e^{-i \pi 4}), \quad \psi_- := N_\alpha e^{i \alpha \pi 2} K_\alpha (\rho e^{i \pi 4}),$$

**Fermions**
$$d_+ = d_- = 0 \quad \text{(essential self-adjointness)}$$
Hence we have that $\mathcal{H}_\alpha$ admits a 1-parameter family of s.a. extensions,

$$\mathcal{D}(\mathcal{H}_\alpha, \beta) = \mathcal{D}(\overline{\mathcal{H}_\alpha}) \oplus \text{span}_\mathbb{C}\{\psi_+ + e^{i\beta}\psi_-\}$$

$$\equiv \{\psi = \phi + \gamma(\psi_+ + e^{i\beta}\psi_-) | \phi \in \mathcal{D}(\overline{\mathcal{H}_\alpha}), \gamma \in \mathbb{C}\},$$

$$\mathcal{H}_{\alpha, \beta}\psi = \overline{\mathcal{H}_\alpha}\phi + i\gamma\psi_+ - i\gamma e^{i\beta}\psi_-$$

$$= \overline{\mathcal{H}_\alpha}\phi + i\gamma N_\alpha K_\alpha(\rho e^{-i\pi/4}) - i\gamma e^{i(\beta + \alpha\pi/2)} N_\alpha K_\alpha(\rho e^{i\pi/4}),$$

with $\beta \in [-\pi, \pi]$. 
The Friedrichs Extension

In terms of the chosen parametrization, the Friedrichs extension is the one corresponding to $\beta = \pi$. (see below)

Since the symmetric operator $\mathcal{H}_\alpha$ is positive, the existence of the Friedrichs extension is guaranteed. One can find it among the others extensions. by imposing that its domain must be contained in the form domain. The form domain is the set of function which have a square-integrable magnetic gradient $D_\alpha$. Let the form be

$$\begin{align*}
\mathcal{D}(\mathcal{Q}_\alpha) &= \{ \phi \in L^2(\mathbb{R}^2) | D_\alpha \phi \in L^2(\mathbb{R}^2)^2 \}, \\
\mathcal{Q}_\alpha[\phi] &= \| D_\alpha \phi \|^2.
\end{align*}$$

(7)
The Friedrichs Extension

In terms of the chosen parametrization, the Friedrichs extension is the one corresponding to $\beta = \pi$. (see below)

\mathcal{Q}_\alpha &= \{ \phi \in L^2(\mathbb{R}^2) | D_\alpha \phi \in L^2(\mathbb{R}^2)^2 \}, \\
\mathcal{Q}_\alpha[\phi] &= \| D_\alpha \phi \|^2.
\end{align*}
$$

(7)
The first order terms in the expansion of $K_\alpha$ cancel out and it remains a function in the form domain $\mathcal{D}(Q_\alpha)$.

$$D_\alpha (\psi_+ - i\psi_-) \in L^2$$

Plot of $|\psi_+ - i\psi_-|^2$

Plot of $|\psi_+ - i\psi_-|^2$ (closer look)
Def. of the Quadratic Forms

The expectation value of the operator $\mathcal{H}_{\alpha,\beta}$ suggests a possible expression of the quadratic form. We write a parametrization which relies upon the knowledge of the asymptotics of the eigenvalue near the origin. We start from the form associated to the Friedrichs extension:

**Friedrichs’ Form**

We define the quadratic form

$$\mathcal{F}_{\alpha,F}[\psi] := \mathcal{F}_\alpha[\psi] = \int_{\mathbb{R}^2} \text{d}r \left| \left( -i \nabla + \frac{\alpha r^\perp}{r^2} \right) \psi \right|^2,$$

with domain

$$\mathcal{D}[\mathcal{F}_{\alpha,F}] = C_0^\infty(\mathbb{R}^2 \setminus \{0\}) \|_{L^2_{\alpha}} \cap L^2_{\text{even}}.$$
Def. of the Quadratic Forms

The expectation value of the operator $\mathcal{H}_{\alpha,\beta}$ suggests a possible expression of the quadratic form. We write a parametrization which relies upon the knowledge of the asymptotics of the eigenvalue near the origin. We start from the form associated to the Friedrichs extension:

**Friedrichs’ Form**

We define the quadratic form

$$\mathcal{F}_{\alpha,F}[\psi] := \mathcal{F}_{\alpha}[\psi] = \int_{\mathbb{R}^2} \mathrm{d} \mathbf{r} \left| \left( -i \nabla + \frac{\alpha \mathbf{r}_{\perp}}{r^2} \right) \psi \right|^2,$$

with domain

$$\mathcal{D}[\mathcal{F}_{\alpha,F}] = C_0^\infty(\mathbb{R}^2 \setminus \{0\}) \| \alpha \|_\alpha \cap L^2_{\text{even}}.$$
Proposition (Friedrichs extension)

The quadratic form $\mathcal{F}_{\alpha,F}$ is closed and positive on $\mathcal{D}[\mathcal{F}_{\alpha,F}]$ for any $\alpha \in [0, 1]$. Furthermore, for any $\alpha \in (0, 1)$,

$$\mathcal{D}[\mathcal{F}_{\alpha,F}] \subset H^1(\mathbb{R}^2).$$

The associated self-adjoint operator $H_{\alpha,F}$ acts as $H_{\alpha}$ on the domain

$$\mathcal{D}(H_{\alpha,F}) = \{ \psi \in \mathcal{D}[\mathcal{F}_{\alpha,F}] \mid H_{\alpha}\psi \in L^2 \}$$

$$= \{ \psi \mid \psi|_{\mathcal{H}_n} \in H^2(\mathbb{R}^2), \forall n \neq 0;$$

$$\psi_0 \in H^2(\mathbb{R}^2 \setminus \{0\}) \cap H^1(\mathbb{R}^2), \psi_0(r) \sim r^\alpha + o(r) \}.$$
All the other forms are defined decomposing the wave function in a regular part and in a singular one.

The family of quadratic forms $\mathcal{F}_{\alpha,\beta}[\psi]$, $\alpha \in (0, 1)$ and $\beta \in \mathbb{R}$, is defined as

$$
\mathcal{F}_{\alpha,\beta}[\psi] := \mathcal{F}_\alpha[\phi_\lambda] - 2\lambda^2 \Re q \langle \phi_\lambda | G_\lambda \rangle + \left[ \beta + (1 - \alpha) c_\alpha \lambda^{2\alpha} \right] |q|^2
$$

$$
\mathcal{D}[\mathcal{F}_{\alpha,\beta}] = \{ \psi \in L^2_{\text{even}} \mid \psi = \phi_\lambda + qG_\lambda, \phi_\lambda \in \mathcal{D}[\mathcal{F}_\alpha,F], q \in \mathbb{C} \},
$$

and $G_\lambda$, $\lambda \in \mathbb{R}^+$, is the defect function

$$
G_\lambda(r) := \lambda^\alpha K_\alpha(\lambda r),
$$

with $K_\alpha$ the modified Bessel function of index $\alpha$. The coefficient $c_\alpha$ is given by

$$
c_\alpha := \frac{\lambda^{2-2\alpha} \| G_\lambda \|^2_2}{\alpha} = \frac{\pi^2}{\sin \pi \alpha} > 0
$$
**Closedness and Boundedness**

The forms can be rewritten as

\[
\mathcal{F}_{\alpha,\beta}[\psi] = \mathcal{F}_\alpha[\phi_\lambda] + \lambda^2 \|\phi_\lambda\|^2 - \lambda^2 \|\psi\|^2 + (\beta + c_\alpha \lambda^{2\alpha}) |q|^2,
\]

The Friedrichs form \( \mathcal{F}_{\alpha,F} \) is included in the family and formally recovered for \( \beta = +\infty \), in which case \( q = 0 \) and

\[
\mathcal{D}[\mathcal{F}_\alpha,+\infty] = \mathcal{D}[\mathcal{F}_\alpha,F].
\]
Closedness and Boundedness

The forms can be rewritten as

$$F_{\alpha,\beta}[\psi] = F_{\alpha}[\phi_\lambda] + \lambda^2 \|\phi_\lambda\|_2^2 - \lambda^2 \|\psi\|_2^2 + (\beta + c_\alpha \lambda^{2\alpha}) |q|^2,$$

The Friedrichs form $F_{\alpha,F}$ is included in the family and formally recovered for $\beta = +\infty$, in which case $q = 0$ and

$$\mathcal{D}[F_{\alpha,+\infty}] = \mathcal{D}[F_{\alpha,F}].$$
Closedness and Boundedness

Theorem (M. Correggi, L.O. ‘18)

For any $\alpha \in (0, 1)$ and any $\beta \in \mathbb{R}$, the quadratic form $F_{\alpha, \beta}$ is closed and bounded from below on the domain $\mathcal{D}[F_{\alpha, \beta}]$. Furthermore,

$$
\frac{F_{\alpha, \beta}[\psi]}{\|\psi\|^2} \geq \begin{cases} 
0, & \text{if } \beta \geq 0; \\
-\left(\frac{|\beta| \sin(\pi \alpha)}{\pi^2}\right)^{\frac{1}{\alpha}}, & \text{if } \beta < 0.
\end{cases}
$$

(8)
Sketch of the Proof: Boundedness

First, one drops the summands $F_{\alpha}[\phi_{\lambda}]$ and $\lambda^2 \|\phi_{\lambda}\|^2$, then

$$F_{\alpha,\beta}[\psi] \geq -\lambda^2 \|\psi\|^2 + (\beta + c_\alpha \lambda^{2\alpha}) |q|^2,$$

which implies that if $\beta \geq 0$ the form is positive when one takes $\lambda$ arbitrarily small.

If $\beta < 0$, one can exploit the freedom in the choice of $\lambda$ and get that if $\lambda = \left(\frac{|\beta|}{c_\alpha}\right)^{\frac{1}{2\alpha}}$, then

$$F_{\alpha,\beta}[\psi] \geq -\lambda^2 \|\psi\|^2.$$
**Sketch of the Proof: Closedness**

We investigate the form $\widetilde{F}_{\alpha,\beta}[\psi] := F_{\alpha,\beta}[\psi] + \lambda^2 \|\psi\|_2^2$.

With the choice of $\lambda$ made before, one has

$$\widetilde{F}_{\alpha,\beta}[\psi_n - \psi_m] \geq F_{\alpha,F}[\phi_n - \phi_m] + \lambda^2 \|\phi_n - \phi_m\|_2^2 + C_{\alpha,\beta}|q_n - q_m|^2,$$

if we now take a sequence in $D[F_{\alpha,\beta}]$ s.t.

$$\lim_{n,m \to \infty} \widetilde{F}_{\alpha,\beta}[\psi_n - \psi_m] = 0, \quad \lim_{n,m \to \infty} \|\psi_n - \psi_m\|_2^2 = 0,$$

by positivity we find

$$\psi_n \xrightarrow[n \to \infty]{} \phi\lambda + qG\lambda \in D[F_{\alpha,\beta}],$$

$\phi, q$ being the limit respectively of $\{\phi_n\}, \{q_n\}$. 
Operators and Boundary Conditions

Corollary (Self-adjoint operators $H_{\alpha,\beta}$)

The one-parameter family of self-adjoint operators associated to the forms $\mathcal{F}_{\alpha,\beta}$, $\alpha \in (0, 1)$ and $\beta \in \mathbb{R}$, is given by

\[(H_{\alpha,\beta} + \lambda^2) \psi = (H_{\alpha} + \lambda^2) \phi_\lambda,\]

\[\mathcal{D}(H_{\alpha,\beta}) = \left\{ \psi \in L^2_{\text{even}} \mid \psi_n \in \mathcal{D}(H_{\alpha,F}), \forall n \neq 0; \psi_0 = \phi_\lambda + qG_\lambda, \quad \phi_\lambda \in \mathcal{D}(H_{\alpha,F}), \quad q = -\frac{2\alpha \Gamma(\alpha + 1)}{(\beta + c_\alpha \lambda^{2\alpha})} \lim_{r \to 0^+} \frac{\phi_\lambda(r)}{r^\alpha} \right\},\]

where $\lambda > 0$ is free to choose provided $\beta + c_\alpha \lambda^{2\alpha} \neq 0$.

Furthermore, the operators $H_{\alpha,\beta}$ extend $H_{\alpha}$, i.e., $H_{\alpha}|_{\mathcal{D}(H_{\alpha})} = H_{\alpha}$, and, conversely, any self-adjoint extension of $H_{\alpha}$ is included in the family $H_{\alpha,\beta}$, $\beta \in \mathbb{R}$. 
Spectral Properties

Proposition (Spectral properties of $H_{\alpha, \beta}$)

For any $\alpha \in (0, 1)$ and any $\beta \in \mathbb{R}$,

$$\sigma(H_{\alpha, \beta}) = \sigma_{\text{pp}}(H_{\alpha, \beta}) \cup \sigma_{\text{ac}}(H_{\alpha, \beta}),$$

with $\sigma_{\text{ac}}(H_{\alpha, \beta}) = \mathbb{R}^+$ and

$$\sigma_{\text{pp}}(H_{\alpha, \beta}) = \begin{cases} \left\{-\left(\frac{|\beta| \sin(\pi \alpha)}{\pi^2}\right)^{\frac{1}{\alpha}}\right\}, & \text{if } \beta < 0; \\ \emptyset, & \text{otherwise}. \end{cases} \quad (9)$$

The generalized eigenfunctions are

$$\varphi(k, \rho, \theta) = \sum_{m=-\infty}^{m=+\infty} J_{2m+\alpha}(k \rho) e^{im\theta}, \quad (10)$$

where $J_{\alpha}$ is the first Bessel function of order $\alpha$. 

where $J_{\alpha}$ is the first Bessel function of order $\alpha$. 

Remarks

- The domains of the self-adjoint operators are all different and no one is contained in any other.
- The domains of the forms are the same except for the Friedrichs form.
- $\beta < 0$ corresponds to an attractive interaction at the origin, while $\beta \geq 0$ to a repulsive one. In the former case there is a negative eigenvalue.
Remarks

- The domains of the self-adjoint operators are all different and no one is contained in any other.
- The domains of the forms are the same except for the Friedrichs form.
- \( \beta < 0 \) corresponds to an attractive interaction at the origin, while \( \beta \geq 0 \) to a repulsive one. In the former case there is a negative eigenvalue.
Remarks

- **The domains of the self-adjoint operators are all different and no one is contained in any other.**
- **The domains of the forms are the same except for the Friedrichs form.**
- **$\beta < 0$ corresponds to an attractive interaction at the origin, while $\beta \geq 0$ to a repulsive one. In the former case there is a negative eigenvalue.**
Interaction Potential

Let us specify the assumptions we make on the interaction:

**Assumption (Interaction potential $V$)**

Let $V = V(r)$ be a real radial function and let $V_\pm$ denote the positive and negative parts of $V$, respectively, i.e., $V = V_+ - V_-$. Then, we assume that

- $V_+ \in L^2_{\text{loc}}(\mathbb{R}^+) \cap L^\infty([0, \varepsilon))$;
- $V_- \in L^\infty(\mathbb{R}^+)$. 
Regular extension

By analogy with the noninteracting case, we call the Friedrichs form the following quantity

\[ \mathcal{F}_{\alpha,F,V}[\psi] := \mathcal{F}_{\alpha,F}[\psi] + \int_{\mathbb{R}^2} \text{d}r \ V(r) \ |\psi|^2, \tag{11} \]

with domain

\[ \mathcal{D}[\mathcal{F}_{\alpha,F,V}] := \mathcal{C}_0^\infty(\mathbb{R}^2 \setminus \{0\}) \cap \|_{\alpha,V} \cap L^2_{\text{even}}, \tag{12} \]

where \( \|\psi\|_{\alpha,V}^2 := \mathcal{F}_{\alpha,F,V}[\psi] + V_0 \|\psi\|_2^2 \), and

\[ V_0 := \sup_{r \in \mathbb{R}^+} V_-(r). \tag{13} \]
We have the following

*Proposition (Friedrichs extension)*

Let the assumptions on \( V \) hold true. Then, the quadratic form \( \mathcal{F}_{\alpha,F,V} \) is closed and bounded from below on \( \mathcal{D}[\mathcal{F}_{\alpha,F,V}] \) for any \( \alpha \in [0, 1] \). Furthermore, for any \( \alpha \in (0, 1) \),

\[
\mathcal{D}[\mathcal{F}_{\alpha,F,V}] \subset H^1(\mathbb{R}^2). \tag{14}
\]

The associated self-adjoint operator \( H_{\alpha,F,V} \) acts as \( H_{\alpha,V} \) on the domain

\[
\mathcal{D}(H_{\alpha,F,V}) = \{ \psi \in \mathcal{D}(H_{\alpha,F}) \mid V\psi \in L^2 \}. \tag{15}
\]
We set for $\alpha \in (0, 1)$ and $\beta \in \mathbb{R}$

\[
\mathcal{F}_{\alpha, \beta, V} [\psi] = \mathcal{F}_{\alpha, V}[\phi_\lambda] + \lambda^2 \|\phi_\lambda\|^2 - \lambda^2 \|\psi\|^2 + (\beta + c_\alpha \lambda^{2\alpha}) |q|^2,
\]

where $\psi$ belongs to the domain

\[
\mathcal{D}[\mathcal{F}_{\alpha, \beta, V}] = \{ \psi \in L^2_{\text{even}} \mid \psi = \phi_\lambda + qG_\lambda, \phi_\lambda \in \mathcal{D}[\mathcal{F}_{\alpha, F, V}], q \in \mathbb{C} \}.
\]
**Interaction Potential**

**Theorem (Closedness and boundedness from below of $F_{\alpha,\beta,V}$)**

Let the assumptions on $V$ hold true. Then, for any $\alpha \in (0, 1)$ and any $\beta \in \mathbb{R}$, the quadratic form $F_{\alpha,\beta,V}$ is closed and bounded from below on the domain $\mathcal{D}[F_{\alpha,\beta,V}]$. Furthermore,

$$\frac{F_{\alpha,\beta,V}[\psi]}{\|\psi\|^2} \geq \begin{cases} -V_0, & \text{if } \beta \geq 0; \\ - \left(\frac{|\beta|}{c_\alpha}\right)^{\frac{1}{\alpha}} - V_0, & \text{if } \beta < 0. \end{cases} \quad (16)$$
Corollary (Self-adjoint operators $H_{\alpha,\beta,V}$)

Let Ass. 1 hold true. Then, the one-parameter family of self-adjoint operators associated to the forms $F_{\alpha,\beta,V}$, $\alpha \in (0, 1)$, $\phi_\lambda \in D(H_{\alpha,F,V})$ and $\beta \in \mathbb{R}$, is given by

$$(H_{\alpha,\beta,V} + \lambda^2) \psi = (H_{\alpha,V} + \lambda^2) \phi_\lambda,$$

$$D(H_{\alpha,\beta,V}) = \left\{ \psi \mid \psi_n \in D(H_{\alpha,F,V}), \forall n \neq 0; \psi_0 = \phi_\lambda + qG_\lambda, \right\},$$

where $\lambda > 0$ is free to choose provided $\beta + c_\alpha \lambda^{2\alpha} \neq 0$. Furthermore, the operators $H_{\alpha,\beta,V}$ extend $H_{\alpha,V}$, i.e., $H_{\alpha,V} \big|_{D(H_{\alpha,V})} = H_{\alpha,V}$. 
For the $N$-anyon system the analysis is much more complicated.

We aim at finding extensions with the same asymptotics on the coincidence hyperplanes in the 2-particle channels.

The extensions are to be compared with the so called local extensions for fermions/bosons. The idea is to impose

$$\psi(X) = \frac{A_{i,j}}{|x_i - x_j|^{\alpha}} + B_{i,j}|x_i - x_j|^\alpha + o(|x_i - x_j|^\alpha),$$

(17)

when $x_i \to x_j$, where the coefficients $A_{i,j}$ are the same of the singular terms of the 2-particle wave function, while $B_{i,j}$ is more involved, since it must take all the other charges into account.
