### Optimal Control Theory SF 2852

- 1 Course information and course logistics
- 2 Course overview and application examples

Johan Karlsson, KTH

**Optimal Control 2024** 

・ロト ・ 同ト ・ ヨト ・ ヨト

# **Course Information and Course Logistics**

- This is a course on optimal control
  - Optimization problems involving difference or differential equations
  - Many engineering problems are naturally posed as optimal control problems

- Economics and logistics
- Aerospace systems
- Automotive industry
- Autonomous systems and robotics
- Bio-engineering
- Process control
- Power systems

#### **Course Contents**

#### Optimal control is an important branch of mathematics

・ロン ・回 ・ ・ ヨン・

- Roots in the calculus of variations
- Dynamic programming
- Pontryagin minimum principle (PMP)
- Linear quadratic control
- Model predictive control (MPC)

- Johan Karlsson (Email: johan.karlsson@math.kth.se)
- Michele Mascherpa (Email: micmas@kth.se),
  - Office hours: One hour a week. Time/place will be on homepage.

- Lectures: Results, how to use results, proofs
- Exercises: Examples (some background)
- Exam: Focus on using the results to solve problems.

#### **Course Material**

- Optimal Control: Lecture notes
- Exercise notes on optimal control theory
- Some complementary material will be handed out. It will also be posted on the course homepage.

Optimal Control 2024

# Homework

Four homework sets

- HW0 Some basics on linear systems and get started on convex optimization solvers. (No bonus points).
- HW1 Discrete dynamic programming and model predictive control.
- HW2 Computational methods (Project):
- HW3 PMP and related topics.
  - Each homework has 3-5 problems.
  - Must get at least one point on each of the homework sets 1-3.

・ロット ( 母 ) ・ ヨ ) ・ ヨ )

**Optimal Control 2024** 

• Each homework set handed in in time may also give maximum 2 bonus credits for the exam.

### Final Written Exam

The final exam takes place on October 24, 2024 at 8.00-13.00. You must register for the exam during the time period Sept 17-Oct 1. Use "My Pages".

For questions about registrations, etc. contact students affairs office: studentoffice@math.kth.se.

Grade	A	В	С	D	E	FX
Total credit (points)	45-56	39-44	33-38	28-32	25-27	24

- Total credit = exam score + homework score.
- The maximum exam score = 50. Maximum bonus from the homework sets = 6.
- You may use Mathematics Handbook and a formula sheet found on the course homepage.

・ロット ( 母 ) ・ ヨ ) ・ ヨ )

# Project

#### Requirement for PhD version (SF3852, 7.5hp.)

- Project related to development in the world (use data from Gapminder or John Hopkins)
- Presentation ( $\sim$  15 min) and report
- At least B on exam.
- The requirement of B on exam is quite tough.

・ロン ・回 と ・ ヨン・

# **Course Overview and Application Examples**

**Optimal Control 2024** 

- 1 Discrete time optimal control theory
- 2 Continuous time optimal control theory

Johan Karlsson, KTH

#### **Discrete Time Optimal Control**

$$\min \phi(x_N) + \sum_{k=0}^{N-1} f_0(k, x_k, u_k) \quad \text{subj. to} \quad \begin{cases} x_{k+1} = f(k, x_k, u_k) \\ x_0 \text{ given}, x_k \in X_k \\ u_k \in U(k, x_k) \end{cases}$$

The variables  $x_1, \dots, x_N$  (states) and  $u_0, \dots, u_{N-1}$  (controls) are the ones we optimize over.

The functions  $\phi$  and  $f_0$  determine the terminal and running costs.

The function f and sets  $X_k$  and U determine feasible states and controls.

**Optimal Control 2024** 

Sequential decision problem which contain as special cases

- Graph search problems
- Combinatorial optimization
- Discrete time optimal control

Johan Karlsson, KTH

#### Shortest Path problem

# Find the shortest path from the initial node at stage 0 to the terminal node at stage 5

**Optimal Control 2024** 

< ∃⇒

・ロト ・回ト ・ヨト

#### The Knapsack Problem

$$\max \sum_{j=1}^{n} p_j x_j$$
  
subject to  $\sum_{j=1}^{n} w_j x_j \le c$ ,  $x_j = 0$  or  $1, j = 1, ..., n$ .

(ロ) (部) (E) (E) (E)

### **Continuous Time Optimal Control**

$$\min \Phi(t_1, x(t_1)) + \int_{t_0}^{t_1} f_0(t, x(t), u(t)) dt \text{ subj. to } \begin{cases} \dot{x}(t) = f(t, x(t), u(t)) \\ x(t_0) \in S_0, \\ x(t_1) \in S_1 \\ u \in U(x) \end{cases}$$

The variables are the functions x(t) (state trajectory) and u(t) (control signal) that we optimize over.

Sometimes we let also  $t_1$  be a variable.

The functions  $\phi$  and  $f_0$  determine the terminal and running costs.

The function *f* and sets  $S_0$ ,  $S_1$  and U(x) determine feasible states and controls.

#### **Continuous Time Optimal Control**

The feasible solutions should satisfy

$$\begin{cases} \dot{x}(t) = f(t, x(t), u(t)) \\ x(t_0) \in S_0, \quad x(t_1) \in S_1 \\ u \in U(x) \end{cases}$$

The trajectories x(t) should start in  $S_0$  and end in  $S_1$ , *i.e.*,

 $S_0$  and  $S_1$  are manifolds (intersection of surfaces).

Johan Karlsson, KTH

**Optimal Control 2024** 

#### **Optimal Control of Car**

Problem: Shortest time. (= shortest path when constant speed v)

$$\min_{\omega,T} T \quad \text{subj. to} \quad \begin{cases} \dot{x}(t) = v \cos(\theta(t)), \ x(0) = 0, \ x(T) = \bar{x} \\ \dot{y}(t) = v \sin(\theta(t)), \ y(0), \ y(T) = \bar{y} \\ \dot{\theta}(t) = \omega(t), \ \theta(0) = 0, \ \theta(T) = \bar{\theta} \\ |\omega(t)| \le v/R, \ T \ge 0 \end{cases}$$

Johan Karlsson, KTH

#### Orbit Transfer of Satellite

#### Problem: Orbit transfer

< ≣ > ≣ ৩৭০ Optimal Control 2024

<ロ> <同> <同> < 同> < 同>

Johan Karlsson, KTH

#### Orbit Transfer of Satellite

#### Problem:

$$\max_{u} x_{1}(T) \qquad \text{s.t.} \begin{cases} \dot{x}_{1} = C_{3}^{2} x_{2} \\ \dot{x}_{2} = \frac{x_{3}^{2}}{x_{1}} - \frac{1}{x_{1}^{2}} + \frac{\sin u}{1/c_{1} - c_{2}c_{3}t} \\ \dot{x}_{3} = -\frac{c_{3}^{2} x_{2} x_{3}}{x_{1}} + \frac{c_{3} \cos u}{1/c_{1} - c_{2}c_{3}t} \\ x(0) = (1 \ 0 \ 1)^{T} \\ S_{f} = \{x \in \mathbf{R}^{3} | x_{2} = 0, \ x_{3} - \frac{1}{\sqrt{x_{1}}} = 0\} \end{cases}$$

Johan Karlsson, KTH

< ≣ ► ≣ ৩৭০ Optimal Control 2024

▲口 > ▲御 > ▲ 臣 > ▲ 臣 > -

#### **Resource Allocation**

$$\max_{u(\cdot)} \int_{0}^{T} (1 - u(t))x(t)dt + x(T)$$
  
subj. to 
$$\begin{cases} \dot{x}(t) = \alpha u(t)x(t), \ (0 < \alpha < 1) \\ x(0) = x_{0} > 0 \\ u(t) \in [0, 1], \forall t \end{cases}$$

- A portion *u*(*t*) of the production rate *x*(*t*) is invested in the factory (and increases the production capacity)
- The rest (1 u(t))x(t) is stored in a warehouse.
- Maximimize the sum of the total amount of goods stored in the warehouse and the final capacity of the factory.

# **Optimal Control Theory**

• Feedback control  $u(t) = \psi(t, x(t))$  (depends on state)

• Open loop control  $u(t) = \psi(t)$
