

Virtual memory - Swapping

Johan Montelius

KTH

2021

- **1:** Allowing two or more processes to use main memory, given them an illusion of private memory.

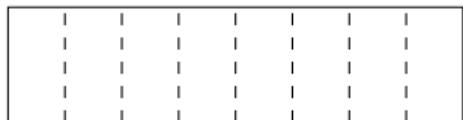

- **1:** Allowing two or more processes to use main memory, given them an illusion of private memory.
- **2:** Provide the illusion of a much larger address space than provided by the main memory.

- **1:** Allowing two or more processes to use main memory, given them an illusion of private memory.
- **2:** Provide the illusion of a much larger address space than provided by the main memory.

- **1:** Allowing two or more processes to use main memory, given them an illusion of private memory.
- **2:** Provide the illusion of a much larger address space than provided by the main memory.

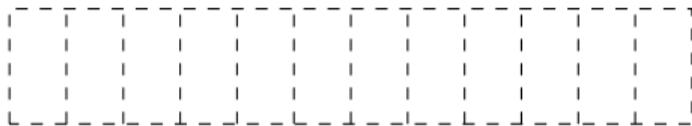

Pages can be temporarily stored in secondary memory i.e. on disk.

The problem of Swapping

- Memory management must detect that a page is currently not in memory.

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?
- If the memory is full, which page do we throw out?

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?
- If the memory is full, which page do we throw out?
- When we throw out a page, do we have to copy it to disk?

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?
- If the memory is full, which page do we throw out?
- When we throw out a page, do we have to copy it to disk?
- Who should do all this, hardware or operating system?

The operating system

The operating system keeps track of all processes and maintains:

The operating system

The operating system keeps track of all processes and maintains:

a memory structure

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

a page table

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

a page table

- Which pages are allocated?

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

a page table

- Which pages are allocated?
- Physical frames of pages or
- .. location on secondary storage.

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

a page table

- Which pages are allocated?
- Physical frames of pages or
- .. location on secondary storage.
- Access rights.

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

a page table

- Which pages are allocated?
- Physical frames of pages or
- .. location on secondary storage.
- Access rights.
- Modified, accessed, cacheable...

The operating system keeps track of all processes and maintains:

a memory structure

- Which segments are allowed.
- Read/write access.
- User/Supervisor mode.
- Copy on write.

a page table

- Which pages are allocated?
- Physical frames of pages or
- .. location on secondary storage.
- Access rights.
- Modified, accessed, cacheable...

The cost of page faults

The cost of memory access:

- TLB hit, address found in cache: $\sim 1ns$

The cost of page faults

The cost of memory access:

- TLB hit, address found in cache: $\sim 1ns$
- TLB hit, address in memory: $\sim 10ns$

The cost of page faults

The cost of memory access:

- TLB hit, address found in cache: $\sim 1ns$
- TLB hit, address in memory: $\sim 10ns$
- TLB miss, page in memory: up to $100ns$

The cost of page faults

The cost of memory access:

- TLB hit, address found in cache: $\sim 1ns$
- TLB hit, address in memory: $\sim 10ns$
- TLB miss, page in memory: up to $100ns$
- TLB miss, page on disk: up to $10ms$

The cost of page faults

The cost of memory access:

- TLB hit, address found in cache: $\sim 1ns$
- TLB hit, address in memory: $\sim 10ns$
- TLB miss, page in memory: up to $100ns$
- TLB miss, page on disk: up to $10ms$

Retrieving from disk is a factor 100.000 times more expensive than finding things in memory.

The cost of page faults

The cost of memory access:

- TLB hit, address found in cache: $\sim 1ns$
- TLB hit, address in memory: $\sim 10ns$
- TLB miss, page in memory: up to $100ns$
- TLB miss, page on disk: up to $10ms$

Retrieving from disk is a factor 100.000 times more expensive than finding things in memory.

What can we do while we're waiting?

The problem with caching - which item do we throw out when the cache is filled?

The problem with caching - which item do we throw out when the cache is filled?

Why try to be smart - pick a page by random.

The problem with caching - which item do we throw out when the cache is filled?

Why try to be smart - pick a page by random.

The problem with caching - which item do we throw out when the cache is filled?

Why try to be smart - pick a page by random.

Are pages referenced randomly?

Locality of references

Memory references are not random in space nor time.

Memory references are not random in space nor time.

- **Temporal locality:** an address that has been referenced is likely to be referenced soon again.
- **Spatial locality:** an address that is close to something that has been referenced is likely to be referenced.

Memory references are not random in space nor time.

- **Temporal locality:** an address that has been referenced is likely to be referenced soon again.
- **Spatial locality:** an address that is close to something that has been referenced is likely to be referenced.

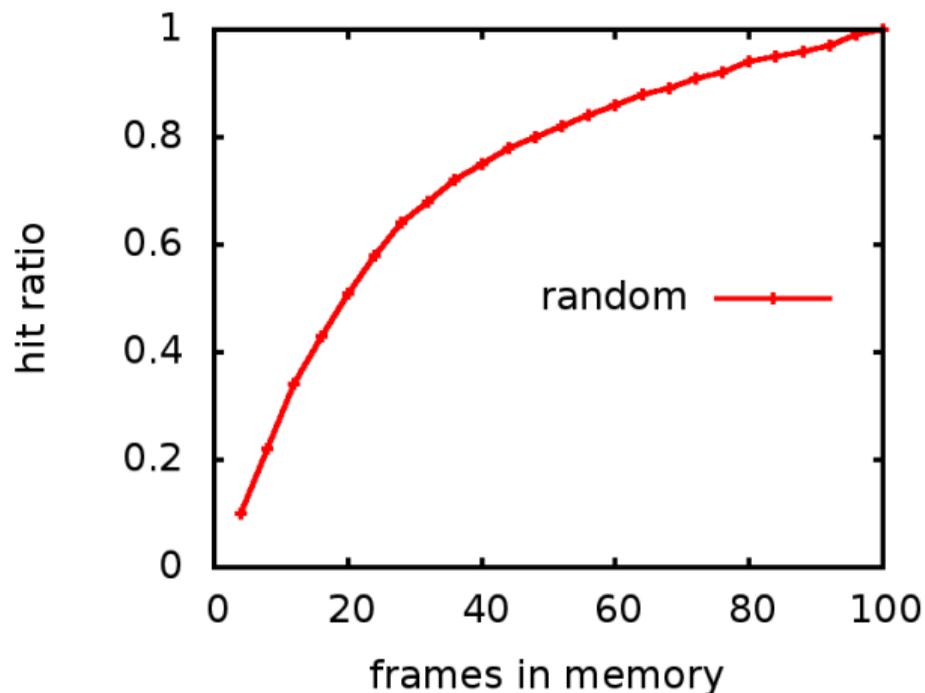

In these benchmarks we have simulated locality by assuming that 20% of the pages are access 80% of the time.

The random policy

When the memory is full select a frame by random and move it to disk.

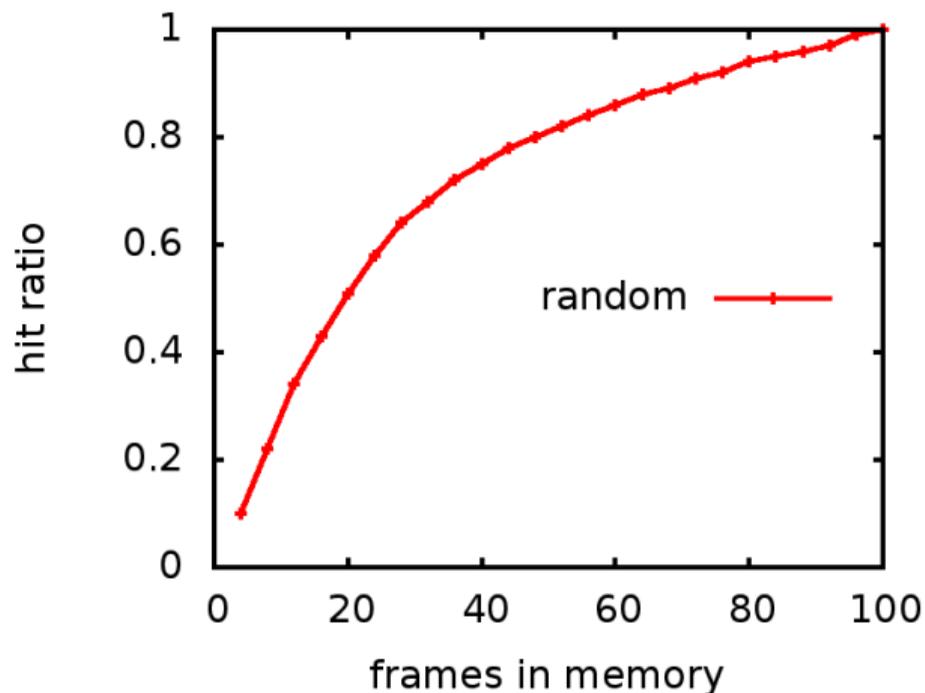

The random policy

When the memory is full select a frame by random and move it to disk.

The random policy

When the memory is full select a frame by random and move it to disk.

Is this good?

- When you need to throw out a page, select the one that will be used *the furthest in the future*.

- When you need to throw out a page, select the one that will be used *the furthest in the future*.
- page references: 0,1,2,3,0,2,3,1,2,0,3,0

We can do better!

2	hit		3,1,2
0	miss	3	1,2,0
3	miss	1	2,0,3
0	hit		2,0,3

Result: two more misses compared to the optimal.

Least Recently Used

Implement Least Recently Used

Keep track of a queue of pages (as many as we have frames).

Implement Least Recently Used

Keep track of a queue of pages (as many as we have frames).

In each page reference, move page to the end of the list.

Implement Least Recently Used

Keep track of a queue of pages (as many as we have frames).

In each page reference, move page to the end of the list.

When evicting a page, select the first page in the list.

Implement Least Recently Used

Keep track of a queue of pages (as many as we have frames).

In each page reference, move page to the end of the list.

When evicting a page, select the first page in the list.

Is this expensive?

- Manchester University, 1962
- 48-bit word, 16 K word memory, 96 K word “drum”
- 24-bit address space
- paged virtual memory
- 512 word pages
- approximated Least Recently Used replacement policy

The problem with LRU is that we need to update the lists in each page reference.

The problem with LRU is that we need to update the lists in each page reference.

The problem with LRU is that we need to update the lists in each page reference.

It is much cheaper if we only update the list when we have a page fault.

The problem with LRU is that we need to update the lists in each page reference.

It is much cheaper if we only update the list when we have a page fault.

Idée: It's better to keep a page that was recently brought in compared to one that has been around for a while.

WTF!

Assume a *reference bit* in the page table entry, initially set to zero.

Assume a *reference bit* in the page table entry, initially set to zero.

When the page is referenced, the bit is set to one - by the hardware.

Assume a *reference bit* in the page table entry, initially set to zero.

When the page is referenced, the bit is set to one - by the hardware.

When selecting a page for eviction - select a page with the reference bit set to zero.

Assume a *reference bit* in the page table entry, initially set to zero.

When the page is referenced, the bit is set to one - by the hardware.

When selecting a page for eviction - select a page with the reference bit set to zero.

A page with a reference bit set to one - **is given a second chance**.

Assume a *reference bit* in the page table entry, initially set to zero.

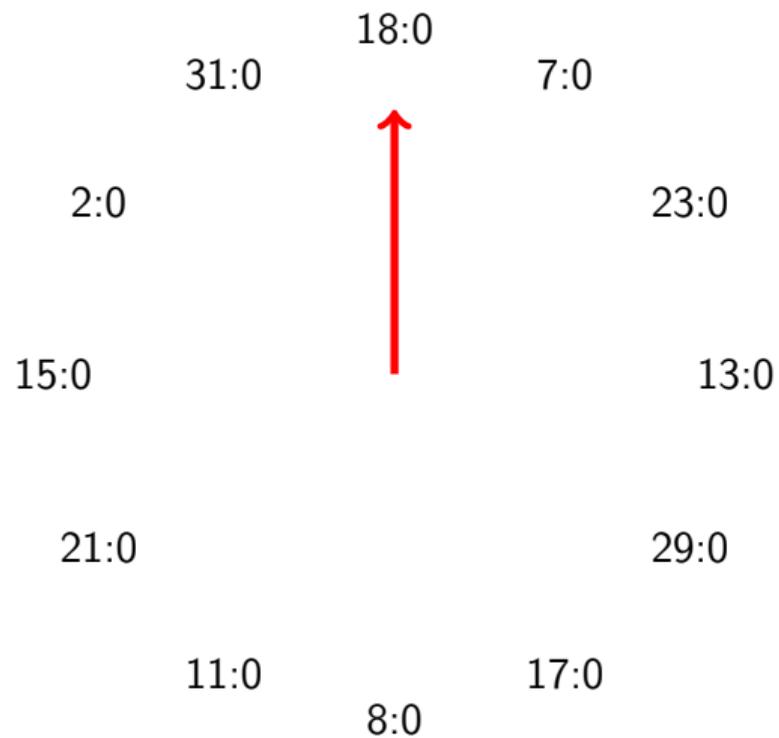

When the page is referenced, the bit is set to one - by the hardware.

When selecting a page for eviction - select a page with the reference bit set to zero.

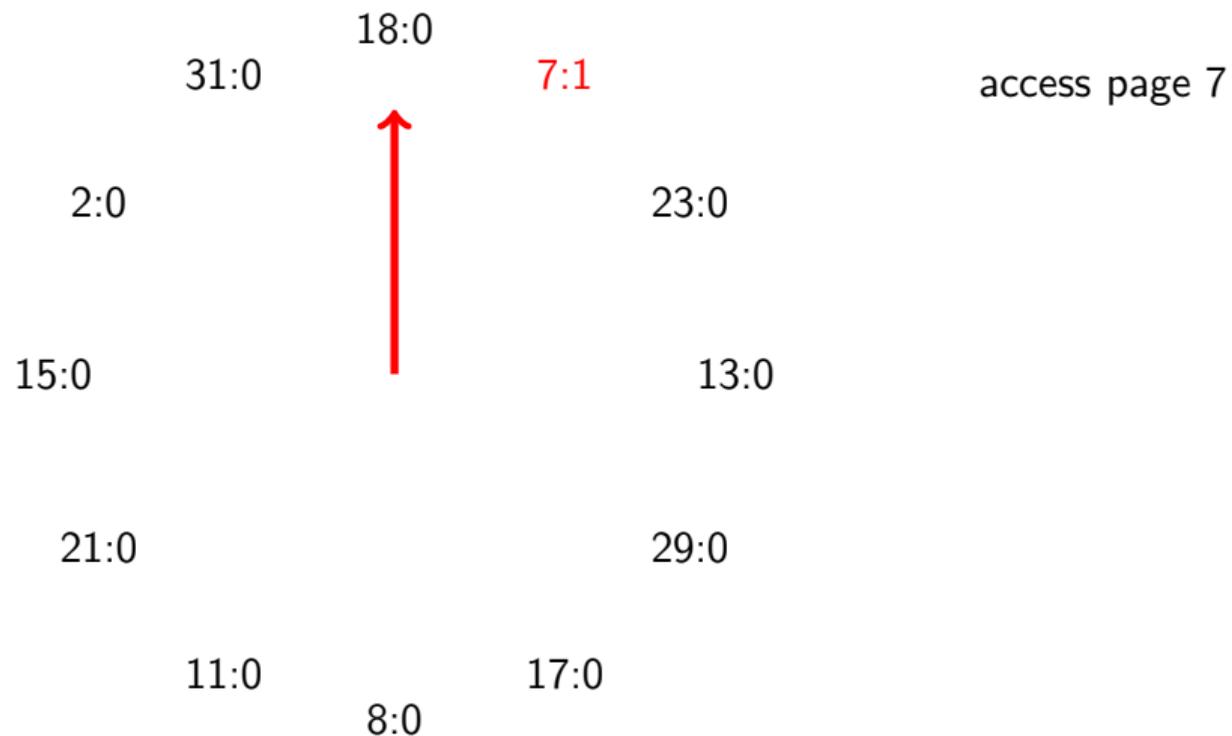

A page with a reference bit set to one - **is given a second chance**.

When should a reference bit be cleared?

Implementation of Page Frame Reclaiming Algorithm in Linux:

Implementation of Page Frame Reclaiming Algorithm in Linux:

- Global i.e. all processes share all frames.

Implementation of Page Frame Reclaiming Algorithm in Linux:

- Global i.e. all processes share all frames.
- Two sets: the *active list* and the *inactive list*.

Implementation of Page Frame Reclaiming Algorithm in Linux:

- Global i.e. all processes share all frames.
- Two sets: the *active list* and the *inactive list*.
- Each set implements an approximation of LRU similar to the clock algorithm.

Implementation of Page Frame Reclaiming Algorithm in Linux:

- Global i.e. all processes share all frames.
- Two sets: the *active list* and the *inactive list*.
- Each set implements an approximation of LRU similar to the clock algorithm.
- Inactive pages are moved from the active to the inactive set and vice versa.

Implementation of Page Frame Reclaiming Algorithm in Linux:

- Global i.e. all processes share all frames.
- Two sets: the *active list* and the *inactive list*.
- Each set implements an approximation of LRU similar to the clock algorithm.
- Inactive pages are moved from the active to the inactive set and vice versa.
- A kernel thread tries to maintain a set of free frames i.e. moving pages from the inactive set to disk before it is needed.

Implementation of Page Frame Reclaiming Algorithm in Linux:

- Global i.e. all processes share all frames.
- Two sets: the *active list* and the *inactive list*.
- Each set implements an approximation of LRU similar to the clock algorithm.
- Inactive pages are moved from the active to the inactive set and vice versa.
- A kernel thread tries to maintain a set of free frames i.e. moving pages from the inactive set to disk before it is needed.
- Operations are batched to improve disk locality and reduce locking.

The problem of Swapping

- Memory management must detect that a page is currently not in memory.

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?
- If the memory is full, which page do we throw out?

The problem of Swapping

- Memory management must detect that a page is currently not in memory.
- If it is not in memory, how do we find it?
- If the memory is full, which page to we throw out?
- When we throw out a page, do we have to copy it to disk?
