

# Secure Vehicular Communication System: Design & Implementation of VPKI

*(Providing Credential Management in a Secure VANET)*

MSc Thesis:

*Mohammad Khodaei*

Supervisor:

*Prof. Panos Papadimitratos*

*LCN – KTH  
October, 2012*

# Outline

- ***Introduction***
  - Problem Statement
  - Contribution
  - Key Concepts
  - Security Requirements
  - Adversary Model
- ***Protocol Design***
- ***Performance Evaluation***
- ***Conclusion***
  - Future Direction

# Outline

  - Security Requirements
  - Adversary Model
- ***Protocol Design***
- ***Performance Evaluation***
- ***Conclusion***
  - Future Direction

# Introduction

- The life cycle of vehicles is pretty long
- Security has to be put in place
- Many attacks which could jeopardize the system performance from security point of view
- Mitigating unknown threats and upcoming attacks

# Problem

- The lack of an infrastructure
- Exposed to different threats and attacks
- Staging attacks to jeopardize users' privacy and disclose confidential information
- Exploiting the vulnerabilities
- Violating the VC system security policy
- What to do to thwart the threats and make the system operations secure?

# Contribution

- **Research Purpose**

- Design and Implementation of VPKI for the secure VC system
- An infrastructure called VPKI, to enable entities communicate securely
- Providing Credential Management in a Secure VC system
- PKI is considered as an essential requirement to provide security services

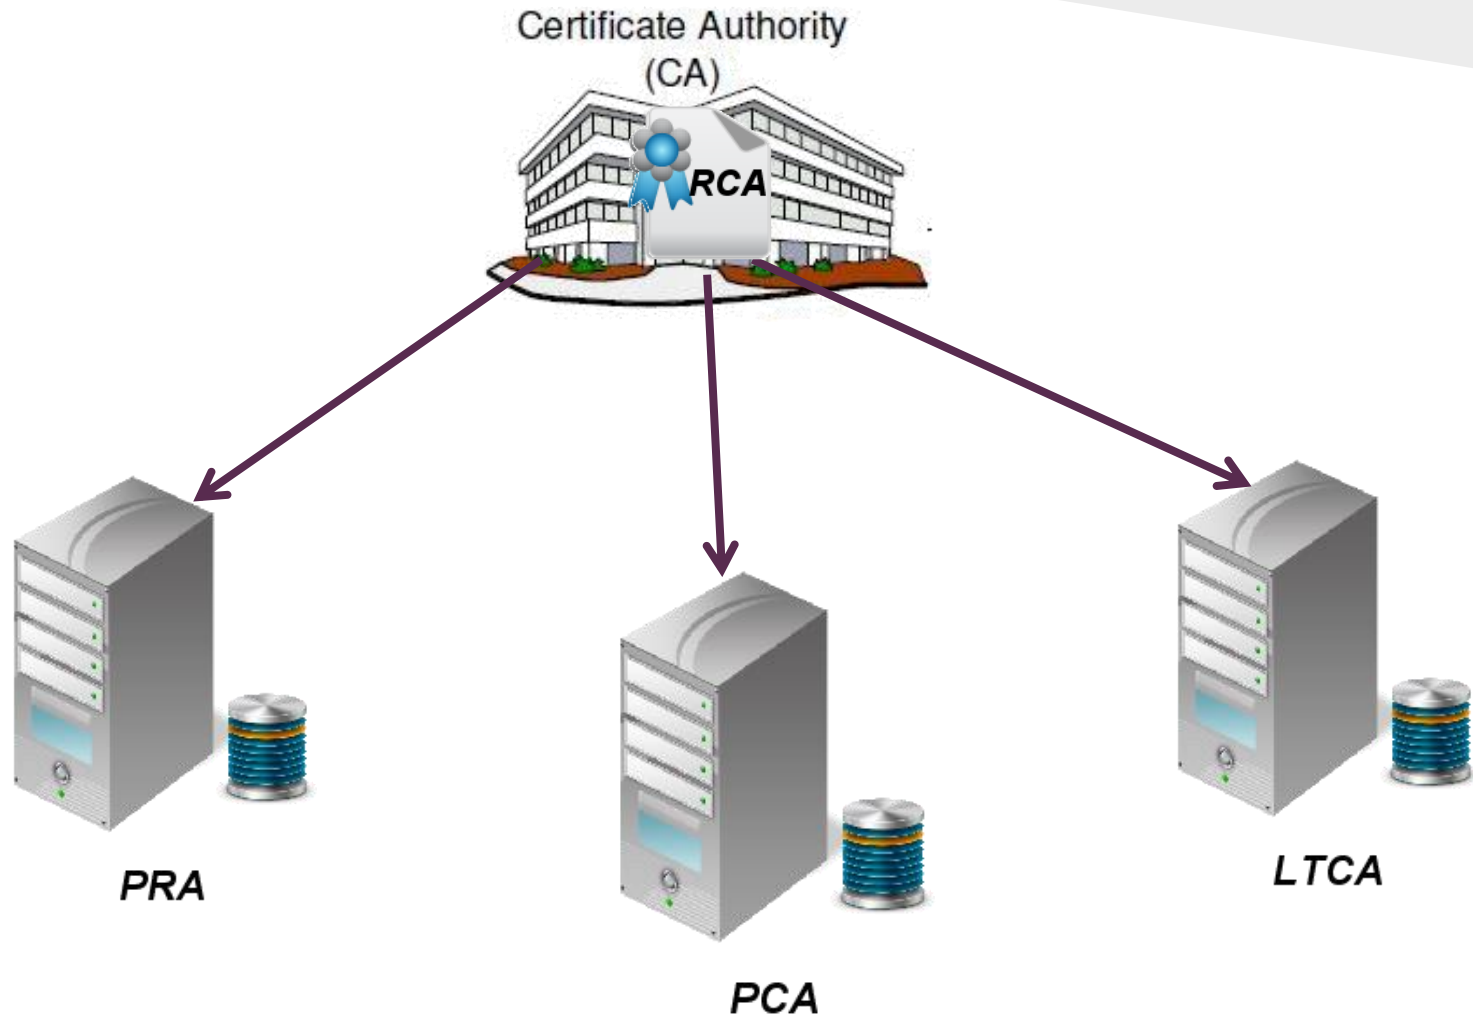

- **Goal**

- Build an artifact, using the currently available open-source PKI, OpenCA, equipped with extra protocols for VANET

- **Methodology**

- Designing and Implementation of extra protocols for VANET
- Using Open-Source OpenCA

# Key Concepts

# Key Algorithms and Size

<b><i>Entities</i></b>	<b><i>Algorithm</i></b>
<b><i>PCA</i></b>	<b><i>RSA, key size: 1024-bit ECDSA, key size: 256-bit</i></b>
<b><i>LTCA</i></b>	<b><i>RSA, key size: 1024-bit ECDSA, key size: 256-bit</i></b>
<b><i>PRA</i></b>	<b><i>RSA, key size: 1024-bit ECDSA, key size: 256-bit</i></b>
<b><i>Police</i></b>	<b><i>RSA, key size: 1024-bit ECDSA, key size: 256-bit</i></b>
<b><i>Vehicle</i></b>	<b><i>RSA, key size: 1024-bit ECDSA, key size: 256-bit</i></b>

# Why not normal PKI?

- Pseudonymity
- Unlinkability
- Unobservability
- User's Privacy

# Security Requirements

- Message Authentication and Integrity
- Message Non-Repudiation
- Privacy
  - Anonymity
  - Unlinkability and Unobservability
- Pseudonym Resolution
  - Liability Identification, Forensics Investigation
- Message Confidentiality
- Availability, Fault-Tolerant and Robustness
- Scalability and Performance

# Adversary Model

- Localized and Selective Denial of Communication
- Internal Active Adversaries
  - a. Modification and Tampering
  - b. Forgery
  - c. Recollecting Past Messages
  - d. Multiple Adversarial Nodes
- Bounded Adversarial Presence
- Input-Controlling Adversary
- Other Adversary Models (Byzantine, Dolev-Yao (DY))

# Related Work

- V-Tokens for Conditional Pseudonymity in VANETs
  - Resolution information is embedded in pseudonyms
  - Vehicle signs using its current valid pseudonym
  - Pseudonym information is encrypted with PK\_PR
  - Uses separation of duties
  - Cooperation of a subset of RAs is required to perform pseudonym resolution

# Outline

- Performance Evaluation
- Conclusion
  - Future Direction

# Protocol Design

- How to Request for Pseudonymous Certificates
- How to Request the Latest Pseudonym CRL
- How to Perform Pseudonym Resolution

# Obtaining Pseudonym Cert.

## Two Steps:

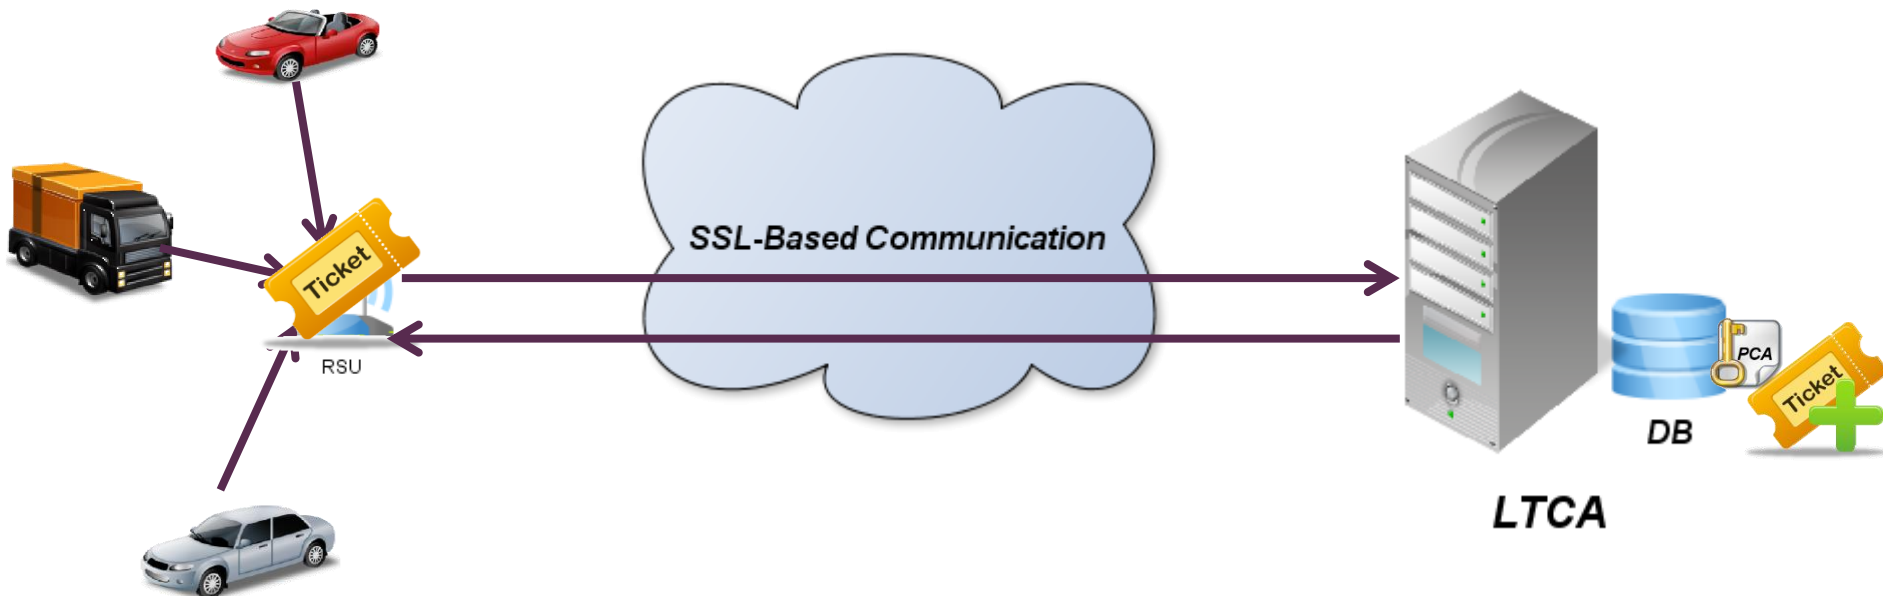

### a. **Obtain a Token**

- i. *Vehicle queries LTCA*
- ii. *LTCA issues an encrypted Token with PCA's Public key, if it is a legitimate vehicle*
- iii. *Vehicle stores the Token for the second step*

### b. **Obtain Pseudonymous Certificates**

- i. *Vehicle sends the Token to PCA*
- ii. *PCA verified the Token locally*
- iii. *PCA issues short-term certificate*

# Obtaining a Token

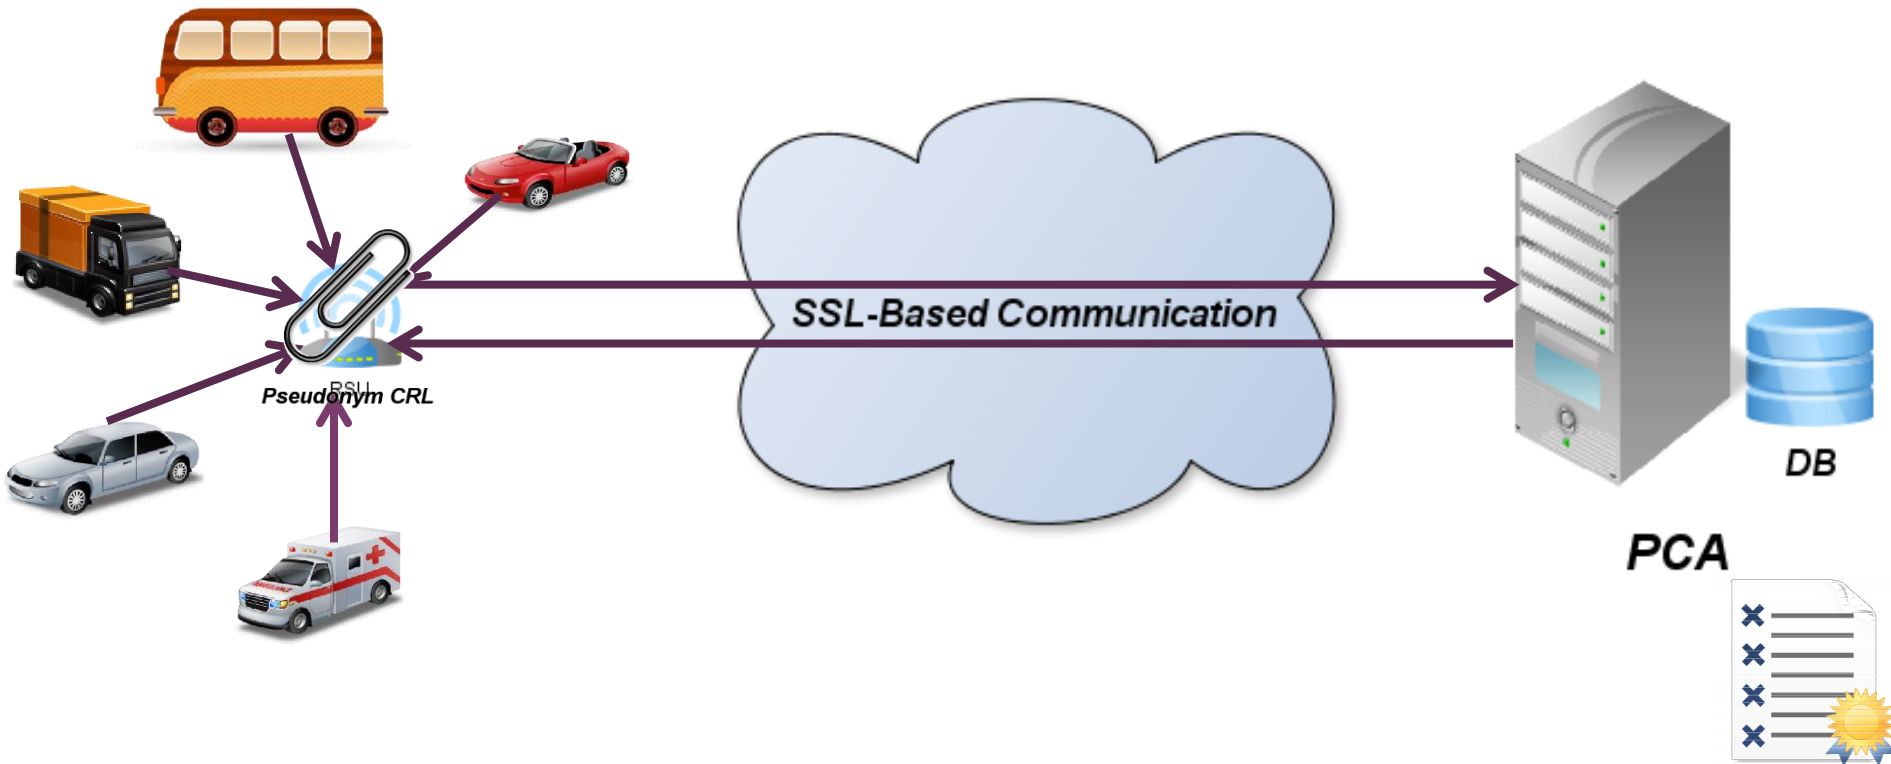

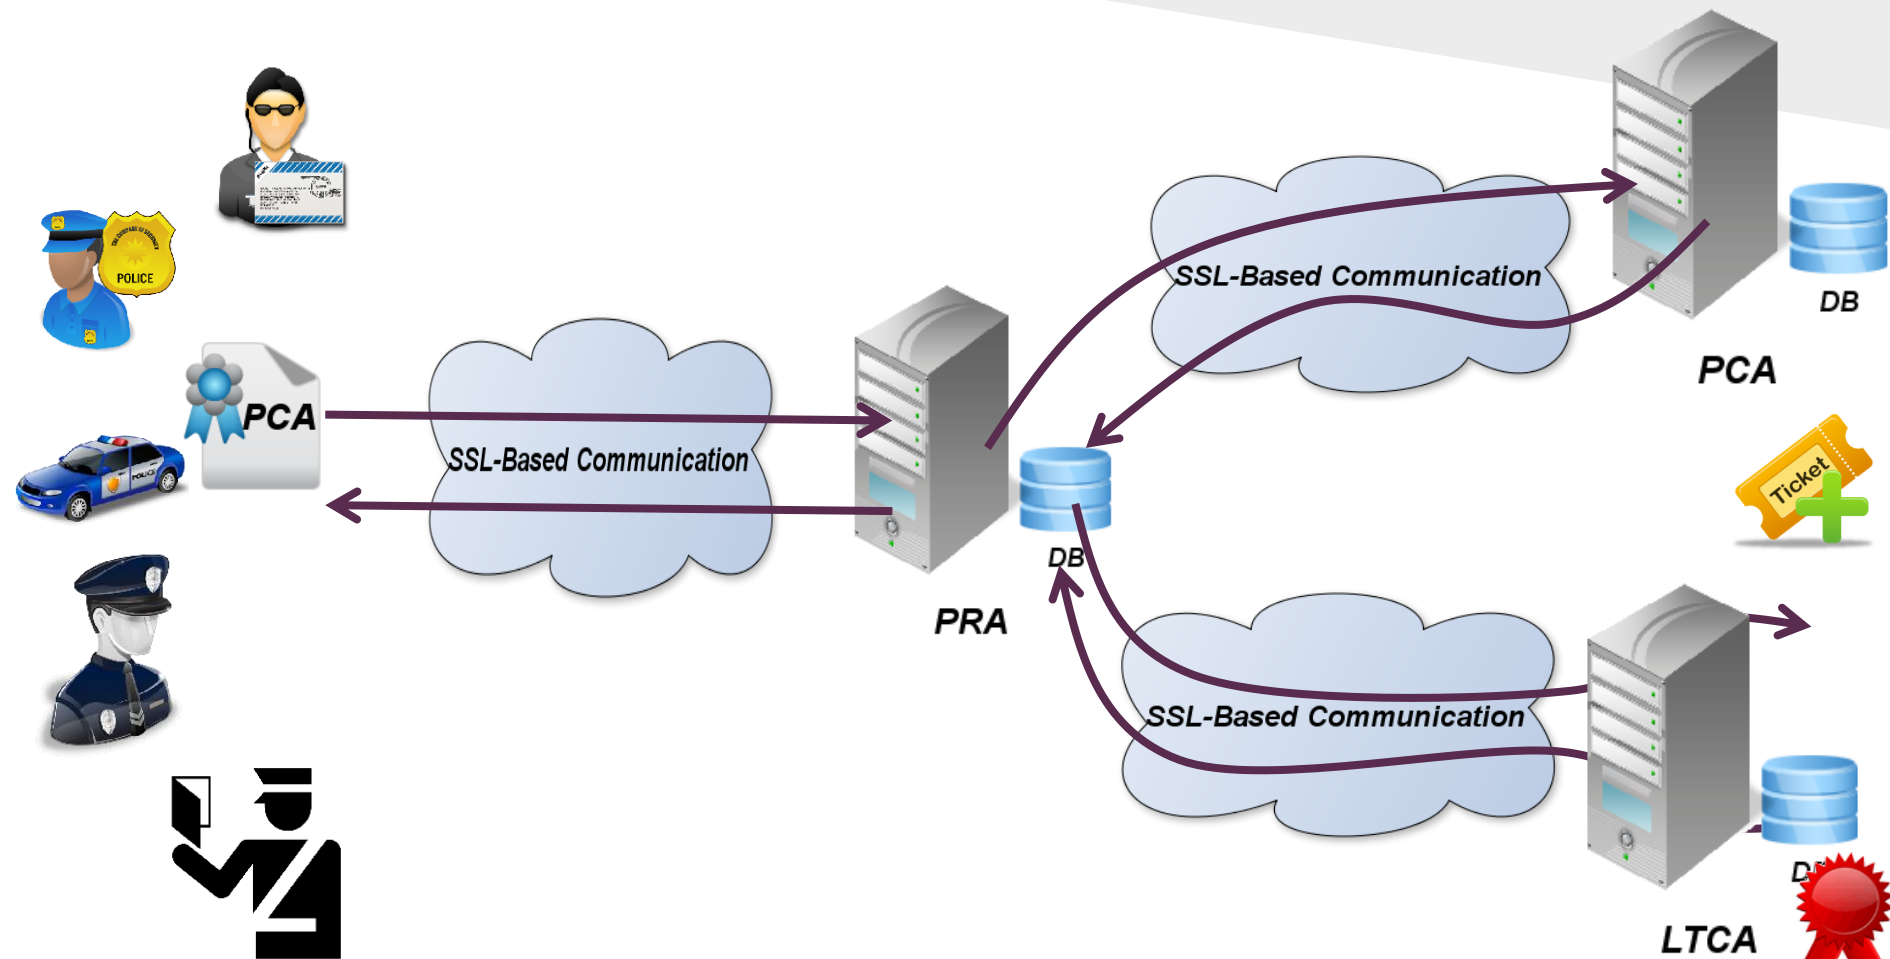

# Obtaining Pseudonym Cert.

# Obtaining Pseudonym CRL

# Pseudonym Resolution

# Token & Pseudonym Format

<i><b>Token Format</b></i>
<i>Token-Type</i>
<i>Token-Serial No.</i>
<i>Token-Identifiable-Key</i>
<i>LTCA-Id, PCA-Id</i>
<i>Maximum Number of Pseudonym Certificates</i>
<i>Token Start-Time</i> <i>Token Expiry-Time</i>
<i>Pseudonym Start-Time</i> <i>Pseudonym Expiry-Time</i>
<i>Signature</i>

<i><b>Pseudonym Cert. Format</b></i>
<i>Serial No.</i>
<i>Pseudonym Cert. Identifiable Key</i>
<i>Signer-ID</i>
<i>Valid-From</i> <i>Valid-To</i>
<i>EC Public key</i>
<i>Signature</i>

# Pseudonym CRL Format

<b><i>Pseudonym CRL Format</i></b>
<i>Pseudonym-CRL Serial No.</i>
<i>CRL Version</i>
<i>PCA-Id</i>
<i>Revoked Pseudonym-Cert. No.</i>
<i>Revoked Pseudonym-Cert. Serial No.</i>
<i>Time-Stamp</i>
<i>Signature</i>

# Binding Token to Pseudo- Cert.

- LTCA:
  - ***Token-Identifiable-Key*** = hash(Vehicle Long-Term Certificate Serial No. || Time-Stamp || Nonce)
- PCA:
  - PseuCertIdentifiableKey = hash(***Token-Identifiable-Key*** || Pseudo-Public Key || Time-Stamp || Nonce)

# Network Topology

# Servers & Client Spec.

- Servers:

<b><i>Processor Model Name</i></b>	<b><i>Intel(R), Dual-Core, Xeon(TM), CPU 3.40GHz</i></b>
<b><i>Bogomips</i></b>	<b><i>6782.71</i></b>
<b><i>RAM</i></b>	<b><i>8 GB</i></b>

- Client:

<b><i>Processor Model Name</i></b>	<b><i>Intel(R), Dual-Core(TM), CPU 3.00 GHz</i></b>
<b><i>Bogomips</i></b>	<b><i>5960.58</i></b>
<b><i>RAM</i></b>	<b><i>2 GB</i></b>

# Obtaining Token from LTCA

# Time Interval to Obtain 10 Pseudonyms

# Time Intervals for Different Operations to Obtain Pseudonym Certificates

# Time Interval to Obtain 20,000 Pseudonyms from PCA

# Time Intervals for Different Operations to Obtain Pseudonym CRL

# Pseudonym CRL File Size

<b><i>No. of Revoked Pseudonyms in CRL</i></b>	<b><i>Size in bytes</i></b>
<b><i>1</i></b>	<b><i>778 bytes (778 bytes)</i></b>
<b><i>10</i></b>	<b><i>1.36 KB (1,398 bytes)</i></b>
<b><i>100</i></b>	<b><i>7.33 KB (7,507 bytes)</i></b>
<b><i>1000</i></b>	<b><i>67.1 KB (68,723 bytes)</i></b>
<b><i>10,000</i></b>	<b><i>664 KB (680,718 bytes)</i></b>
<b><i>20,000</i></b>	<b><i>1.29 MB (1,360,714 bytes)</i></b>
<b><i>100,000</i></b>	<b><i>6.48 MB (6,800,715 bytes)</i></b>

# Outline

- Introduction
  - Problem Statement
  - Contribution
  - Key Concepts
  - Security Requirements
  - Adversary Model
- Protocols Design
- Performance Evaluation
- **Conclusion**
  - ***Future Direction***

# Conclusion

- Three protocols are integrated into OpenCA to provide security functionality for VANETs
- Improvement in compare with similar projects
  - Linkability
  - Privacy
  - Pseudonym Resolution
- Performance evaluation shows reasonable time to obtain pseudonyms, CRL and pseudonym resolution
- Experiments should be done on a vehicle for a more precise result

# Future Direction

- Providing a PKI Trust Model in VANETs
  - Introducing a new PCA, LTCA and PRA
  - Foreign Pseudonym Certificates
  - Integrating Short-Term CRLs from Different PCAs
- Token Should be Used Only Once
- Mitigate the Threat of Sybil Attack
  - resource testing techniques, social networking approaches, radio testing, trusted certification

# Future Direction Cont.

- Token Verification by any PCA to Enhance Privacy
- Performing Reverse Pseudonym Resolution
- Resolving Multiple Pseudonyms in a Request
- Using FastCGI instead of CGI
- Performance and Efficiency for VANETs

# Questions

***Thanks for your attention!***

# Obtaining Pseudonym Cert.

# OpenCA

- Written in C
- Two packages:
  - openca-base
  - openca-tools
- Uses Open-SSL Libraries
- Support Open-LDAP
- Web-based Interface
- With an Apache-style license

# Token Req-Res Format

<b><i>Token Request</i></b>	<b><i>Token Response</i></b>
<i>Req. Type</i> <i>X509 VLTC Length</i> <i>X509 VLTC</i> <i>Pseudonym Cert. No. Request</i> <i>LTCA-Id</i> <i>PCA-Id</i> <i>Nonce</i> <i>Time-Stamp</i> <i>Signature</i>	<i>Req. Type</i> <i>Token Size</i> <i>Token</i> <i>Max No. Pseudonym Cert.</i> <i>LTCA-Id</i> <i>PCA-Id</i> <i>Nonce</i> <i>Time-Stamp</i> <i>Error-Info</i> <i>Signature</i>

# Pseudonym Req-Res Format

<i>Pseudonym Request</i>	<i>Pseudonym Response</i>

# Obtaining Pseudonyms from PCA

# Obtaining Pseudonym CRL

# Percentage of Different Operations to Obtain 20000 Pseudonyms

# Implementation

- C++
- OpenCA as the base implementation
- Installed and configured PCA , LTCA and PRA on Different Servers
- Libraries:
  - OpenSSL
  - Xmlrpc
  - MySQL
  - Boost-Serialization

# Time Intervals to Obtain a Token from LTCA

<i><b>Operations</b></i>	<i><b>Latency in ms</b></i>
<i>Preparing Token Request</i>	<i>4.95 ms</i>
<i>Issuing the Token (Server Side)</i>	<i>8.75 ms</i>
<i>Entire Communication</i>	<i>83.6 ms</i>
<i>Verification and Storage of the Token</i>	<i>3.65 ms</i>
<i>Entire Operations</i>	<i>100.75 ms</i>

<i>Token Size</i>	<i>477 bytes</i>
-------------------	------------------

<i>Pseudonym Certificate Size</i>	<i>2.0 KB (2078 bytes)</i>
<i>Pseudonym Private-Key File Size</i>	<i>5.0 KB (5153 bytes)</i>
